"An unusual structural motif of antimicrobial peptides containing end-to-end macrocycle and cystine-knot disulfides.";

Proc. Natl. Acad. Sci. U.S.A. 96:8913-8918(1999).

-!- FUNCTION: PROBABLY PARTICIPATES IN A PLANT DEFENSE MECHANISM. HAS ANTIBIOTIC ACTIVITY. INHIBITS NEUROTENSIN BINDING. ACTIVE AGAINST BOTH GRAM-POSITIVE AND GRAM-NEGATIVE BACTERIA.

-!- FUNK: THIS IS A CYCLIC PEPTIDE.

-!- SIMILARITY: BELONGS TO THE CYCLOTIDE FAMILY.

-!- CAUTION: THIS PEPTIDE BEING CYCLIC, ITS SEQUENCE WAS ARBITRARILY CHOSEN TO START AT THE POSITION SHOWN BELOW. AS THE DNA SEQUENCE FROM WHICH IT IS DERIVED IS NOT YET KNOWN, IT IS NOT POSSIBLE TO ASSIGN THE CORRECT N- AND C-TERMINI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "Purification, primary structures, and antibacterial activities of beta-defensins, a new family of antimicrobial peptides from bovine neutrophils.";

human secreted proteins, and encode the proteins given in AAY12561 to human secreted proteins, and encode the proteins given in AAY12561 to AAY12514, respectively. The proteins given represent the signal peptide and an N-terminal fragmen of a secreted protein. The nucleic acid sequences can be used for producins secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, call protificration/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, receptor/ligand activity, anti-inflammatory thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, den for activity or other activity. The products can be used in forensic, gene therapy and chromosome mapping promoter. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibeterial; antifungal; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              against recombinant major outer membrane protein (MOMP), and for DNA amplification assays for chlamydial genes, are used to diagnose disease, e.g. autofinmune disease, an inflammatory disease or a disease that occurs in an immuno-compromised individual, associated with Chlamydia infection. The kits are used to detect chlamydial elementary bodies in a sample. They are also used to monitor and/or modify the course of therapy in a patient. The treatment reduces the acellular load of infectious Ebstein Barr virus. The method is also used to treat porphyria, by reducing the number of elementary bodies and applying a drug, e.g. cimetidine, and antioxidants, to reduce the adverse effects associated with porphyria. Sequences AMM95120 to AAM95121 represent constant and variable domain sequences of various Chlamydia species.
                                                                                                                                                                                                                                                                                                                                The invention relates to the diagnosis and management of infections by Chlamydia species. The invention provides a composition that comprises at least two agents, where each of the agents is effective against a different phase of the chlamydial life cycle. The agents are selected from: (a) agents targetted against cryptic phase of chlamydial life cycle; (b) agents targetted against elementary body phase of chlamydial life cycle; (c) agents targetted against replicating phase of chlamydial life cycle; (d) probenicid, and (e) antiporphyric acid. The composition is used to elicit a protective immune response to Chlamydia infection in an animal or human and is applied until the animal or human tests material infected with Chlamydia. Diagnostic kits for antibody assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            forensic; gene therapy; chromosome mapping; signal peptide; upstream regularory sequence; cytokine activity; cell proliferation; differentiation; haematopolesis regulation; tissue growth regulation; reproductive hormone regulation; chemotactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition.

                                                                                                                                                      Sequences AAB37348-B37394 represent the amino acid sequences of 47 human secreted proteins encoded by the genes AAC68081-C68127. The genes and proteins are useful for preventing, ameliocathing or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital;
                                                                                                                                                                                                                                                      (b) Immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colifis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal

an active substance, where the active substance is surrounded by at least one layer consisting of a protein that is cross-linked by an enzyme chosen from the group of lipoxygenase, protein disulfide isomerase, phenol oxidase and peroxidase, lysyl oxidase, protein disulfide reductase, tyrosine oxidase or sulfhydryl oxidases. Enzymes chosen from lipoxygenase, protein disulfide reductase, tyrosine oxidase or sulfhydryl oxidases is protein disulfide reductase, tyrosine oxidase or sulfhydryl oxidases, especially lysyl oxidase are useful for formulation of preparations of active substances. The method of the invention is preparations are useful as food additives or fodder or as pharmaceuticals. AAYS1962 represent fragments of the Pichia pastoris lysyl oxidase which are used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lysyl oxidase; lipoxygenase; protein disulfide isomerase; phenol oxidase; peroxidase; protein disulfide reductase; tyrosine oxidase; food; sulfhydryl oxidase; animal feed.
Manufacture of active preparations comprises cross linking a protein, which surrounds the active substance with an enzyme, especially a novel lysyl oxidase from Pichia pastoris
                                                                                                                                                                                              This invention describes a novel method to manufacture a preparation of

AAY6438 represent the EST-related proteins. AAY64631 to
AAX6438 represent the EST-related proteins. AAX6451 to
AAX13052. The 5 ESTS can be used for producing secreted human gene
products. They can be used for producing secreted human gene
products. They can be used to identify and isolate 5 'untranslated
regions (UTRs) and upstream regulatory regions which control the
location, development stage, rate, and quantity of protein synthesis, as
well as stability of mRNA. The ESTs are also useful as probes for
chromosome mapping, and to obtain full length cDNA clones. The ESTs can
also be used in forensic procedures to identify individuals, or in
diagnostic procedures to identify individuals, or in
gene therapy protocols. The nucleic acids encoding signal peptides can be
used for directing extracellular secretion of a polypeptide or the
peroxidases, lysyl oxidases, protein disulfide reductases, tyrosine oxidases or sulfiydryl oxidases is used to formulate compositions containing active ingredients. (I) is useful for crosslinking protein layers surrounding active ingredients in food, animal feed and pharmaceutical products. The compositions can be formulated without using chemical crosslinking agents. AAY51963-Y51974 represent fragments of the Pichia pastoris lysyl oxidase protein which is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             procedures

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an adenoviral capsid protein comprising a heterologous ligand, where the ligand facilitates binding of the adenovirus to a target cell. The adenoviral vector is used to transfer a transgene to a target cell. The heterologous ligand in the adenoviral capsid protein (especially a fibre or hexon protein or protein IX) adenoviral vector to the target cell. In particular, the adenoviral vector can be used to transfer the human cystic fibrosis transmembrane conductance regulator protein gene to the respiratory epithelium of test animals. The modified adenoviral capsid proteins improve and/or alter the infectious capability of the vector. The present sequence represents an adenovirus haxon protein heterologous ligand used in an example from the present invention.
                    be useful in
insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of new secreted proteins is valuable. AAZ42249 to AAZ42244 and AAZ464644 to AAZ4650 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      amino acid sequence at least 95 % identical to a polypeptide sequence selected from 49 polypeptides encoded by polypeptide sequences included in American Type Culture Collection (ATCC) deposit number 203917, defined in the specification. The products of the invention have cytostatic, antiarthritic, antiasthmatic, immunosuppressive, nootropic; antiarteriosclerotic, antiasthmatic, immunosuppressive, nootropic; tranquiliser, vulnerary, antibacterial, antipsoriatic, antiarthythmic, antirheumatic, cardiant and anti-HIV activity. (I) or a nucleic acid (II) antirheumatic, cardiant and anti-HIV activity. (I) or a nucleic acid (II) condition and for diagnosing a pathological condition or susceptibility to the condition. (I) is useful for identifying a binding partner which is affects the activity of the polypeptide and for identifying an activity of the polypeptide and for identifying as antiplogical sample. (I), (II) can antibody (IV) specific to (I) is also useful for treating or preventing a disease, disorder or condition associated with aberrant expression of (I). Diseases treated or diagnosed include immune disorders such as autoimmune diseases, blood protein disorders, anemia, allergic reactions and conditions such as asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              proliferative disorders, cardiovascular disorders such as arterioarterial fistula, arrhythmias, arteriosclerosis, coronary thrombosis, organ regeneration, cancer, necvascular glaucoma, diabetic retinopathy, rheumatoid arthritis, psoriasis, diseases associated with increased apoptosis that include acquired immunodeficiency syndrome (AIDS),

                                                                                             including cosmetic plastic surgery, to treat fibrosis, reperfusion injury or systemic cytokine damage, to stimulate chondrocyte growth, to prevent skin aging due to subburn, to change a mammal's mental state or physical state by influencing biorhythms, cardiac rhythms, depression, memory, stress and for accelerating wound healing. (I), (II) and/or their agonist or antagonist are useful as food additives or preservatives to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamin, mineral or other nutritional components. (I) is useful in forensic biology for detecting bNA sequences and as diagnostic probes for detecting the presence of specific mRNA in a particular cell type.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to peptides AAB51512 - AAB51537 which represent conserved proteobacterial extracellular domains. Sequences AAB51518 represent peptides homologous to YadA, a yersinia adhesin which is an important virulence determinant of the Yersinia species. The invention includes an antibody which binds to the proteobacterial extracellular peptides, and an immunogenic composition containing the antibody used as a vaccine to prevent infection by a proteobacteria. The polypeptides and antibodies are useful in the treatment and prevention of proteobacterial infections. The polypeptides can also be used to identify compounds which antagonize the binding of a bacterial adhesion to its ligand. The host cell can be used to produce
neurological diseases such as Parkinson's disease, viral, bacterial, fungal or parasitic diseases. They are also used to repair, replace or protect tissue damage by congenital defects, to treat trauma, in surgery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  An isolated polypeptide conserved in proteobacterial extracellular domains used in the treatment and prevention of bacterial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Proteobacteria; extracellular domain; virulence determinant; YadA;

Gene No. 20. This sequence represents a human secreted protein, and is expressed ubiquitously, including T-cells and amygdala. The DNA sequences of the invention and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions

```
ö
can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the DNA sequences. Specific uses are described for each of the DNA sequences and the encoded proteins, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurological disorders, developmental abnormalities and foetal deficiencies, blood disorders, leukaemias, diseases of the immune system (including allergies or asthma), hepatic disease, Alzheimer's and cognitive disorders, schizophrenia, prostate diseases, autoimmune disorders and ADDS. The polypeptides are also useful for identifying
                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NF-AT peptide fragment; transcription complex; autoimmune diseases; immunomodulatory agents; T-cell related conditions; lymphocytic leukaemia; transplant rejection reactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polypeptides can be used as immunomodulatory agents, useful in the diagnosis and treatment of T-cell related conditions, e.g autoimmune diseases, lymphocytic leukaemias and transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA and polypeptide(s) encoding the transcription complex NF-AT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A novel method for preventing and/or reducing cardiac hypertrophy in a patient, comprises administering an NF-AT (nuclear factor of activated T cells) antagonist to decrease the biological activity of NF-AT in myocardial tissue (therefore preventing and/or reducing the level of cardiac hypertrophy). The antagonists may decrease the transcriptional activity, nuclear translocation or dephosphorylation of NF-AT, inhibit binding of calcineurin to NF-AT, stimulate phosphorylation of NF-AT (e.g. binding of calcineurin to NF-AT, stimulate phosphorylation of NF-AT (e.g. antagonist is an antagonist of NF-ATC) (also known as NF-AT4) and not NF-ATC), NF-ATC2 and NF-ATC3 (also known as NF-AT4). The method is used for preventing and/or reducing cardiac hypertrophy in a patient suffering from congestive heart disease (claimed) and for preventing other growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ij

The present sequence is given in a specification relating to a method for identifying a compound which modulates translocation of a nuclear factor of activated T lymphocytes (NF-AT) polypeptide across the nuclear membrane of a cell. The method involves binding the compound to the NF-AT polypeptide. The method is useful for identifying compounds which modulate nuclear translocation of NF-AT present in the cytoplasm and/or in the nucleus of the cell and for identifying agents that modulate phosphorylation/dephosphorylation of NF-AT.
                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                     5

```
haemagglutinin-neuraminidase (HN) protein of the paramyxoviridae. The specification describes 3-D models identifying a proteinaceous substance comprising at least one virus epitope derived from the attachment protein, which corresponds to an antigenic site present on one of the loops of HN. The antigenic sites can be used to produce vaccines, to detect the viruses, and to select the immunodominant
                                                                                                                            Isolated proteinaceous substance - comprising at least one virus epitope derived from an attachment protein of a paramyxovirus
                                                                                                                                                                                                                         AAW97452-571 represent antigenic sites derived from the

                                                                                                                                                                                                                                                                                                        The invention relates to an immunogenic peptide derived from hepatitis B surface antigen (HBSAg) which competes with the hepatitis B surface antigen/annexin V interaction or which binds a compound or antibody competing with the hepatitis B surface antigen/annexin V interaction.

Also claimed are: (1) a combination of the immunogenic peptide and a negatively charged phospholipid; (2) a peptide composition comprising the immunogenic peptide; (3) a vaccine comprising the immunogenic peptide (4) antibodies which specifically bind to the peptide and inhibit binding of HBSAg to annexin V, and (5) a therapeutic composition comprising as an active substance the antibodies of (4).

The vaccine of (3), and the therapeutic composition of (5), can be used as an innoculum to vaccinate humans against an infection with hepatitis and/or hepatitis delta virus. The immunogenic peptide can be used in a method to detect antibodies which are capable of competing with the hepatitis B and/or hepatitis Delta virus surface antigen/annexin V interaction. The immunogenic peptide can also be used to screen for drugs which block the binding between annexin V and the peptide, and as a therapeutic to treat humans infected with hepatitis B virus and/or hepatitis Delta virus. The present sequence represents one of the peptide fragments derived from HBSAG which were synthesised to map the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

; TITLE OF INVENTION: DNA ENCODING TUMOR NECROSIS FACTOR-a AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 39;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Patent No. 5395760
APPLICANT: SMITH, CRAIG A.; GOODWIN, RAYMOND G.; BECKMANN,
                                                                              Sequence 41, Application US/08465982

Patent No. 5863786

GENERAL INFORMATION:
APPLICANT: M.Feldmann, P.W. Gray,
APPLICANT: M.J.C. Turner, F.M Brennan
ITILE OF INVENTION: Medified human TNFalpha (Tumor TITLE OF INVENTION: Necrosis Factor alpha) Receptor NUMBER OF SEQUENCES: 57

CORRESPONDENCE ADDRESS:
ADDRESSEE: Reed & Robbins
                                                                                                                                                                                                                                                                                                                                                                                                    COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, version #1.25

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SwissProt\_39:\* Database : Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The complete mitochondrial DNA sequence of Atlantic cod (Gadus morhua): relevance to taxonomic studies among codfishes.";

Mol. Mar. Biol. Biotechnol. 5:203-214(1996).

-I- FUNCTION: THIS IS ONE OF THE CHAINS OF THE NONENZYMATIC COMPONENT (CF(0) SUBUNIT) OF THE MITOCHONDRIAL ATPASE COMPLEX.

-I- SUBCELLULAR LOCATION: MEMBRANE-BOUND.

-I- SIMILARITY: BELONGS TO THE ATPASE PROTEIN 8 FAMILY.
